# The normal distribution

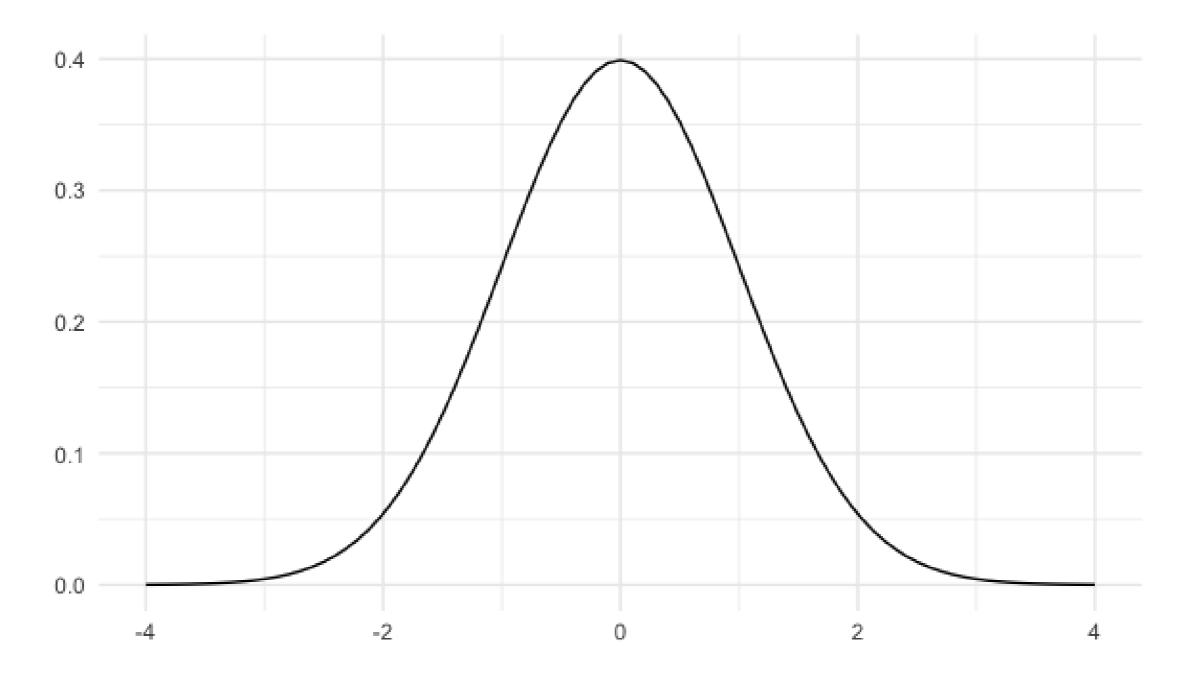

INTRODUCTION TO STATISTICS IN PYTHON

Maggie Matsui Content Developer, DataCamp

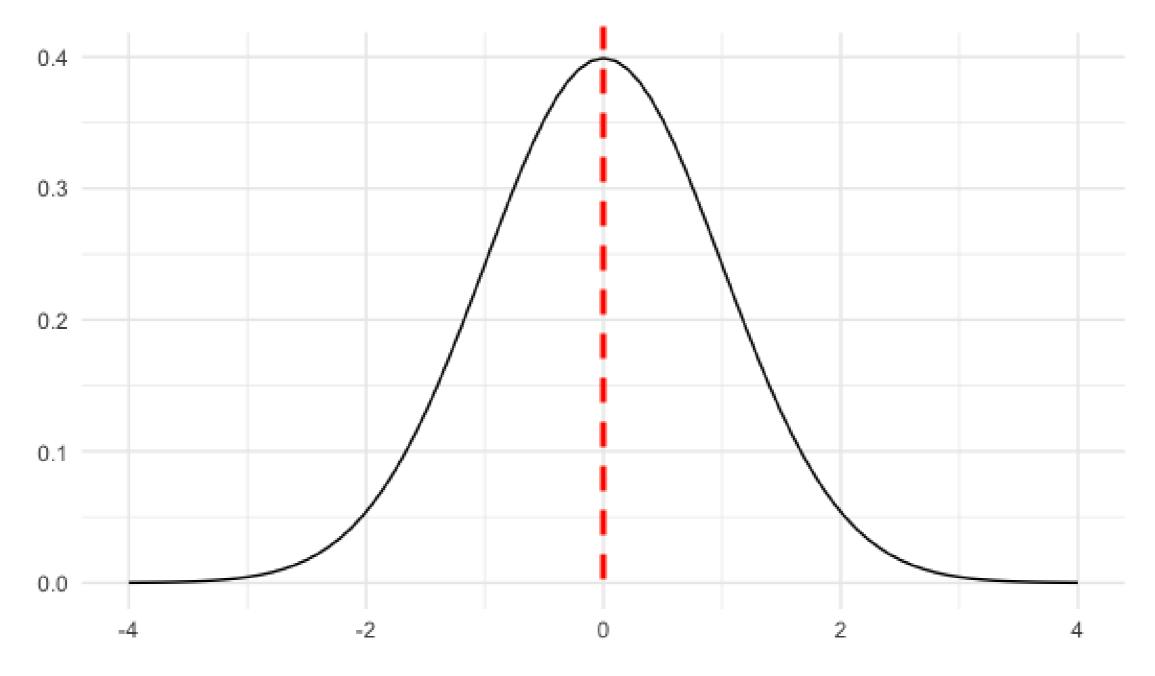

#### What is the normal distribution?

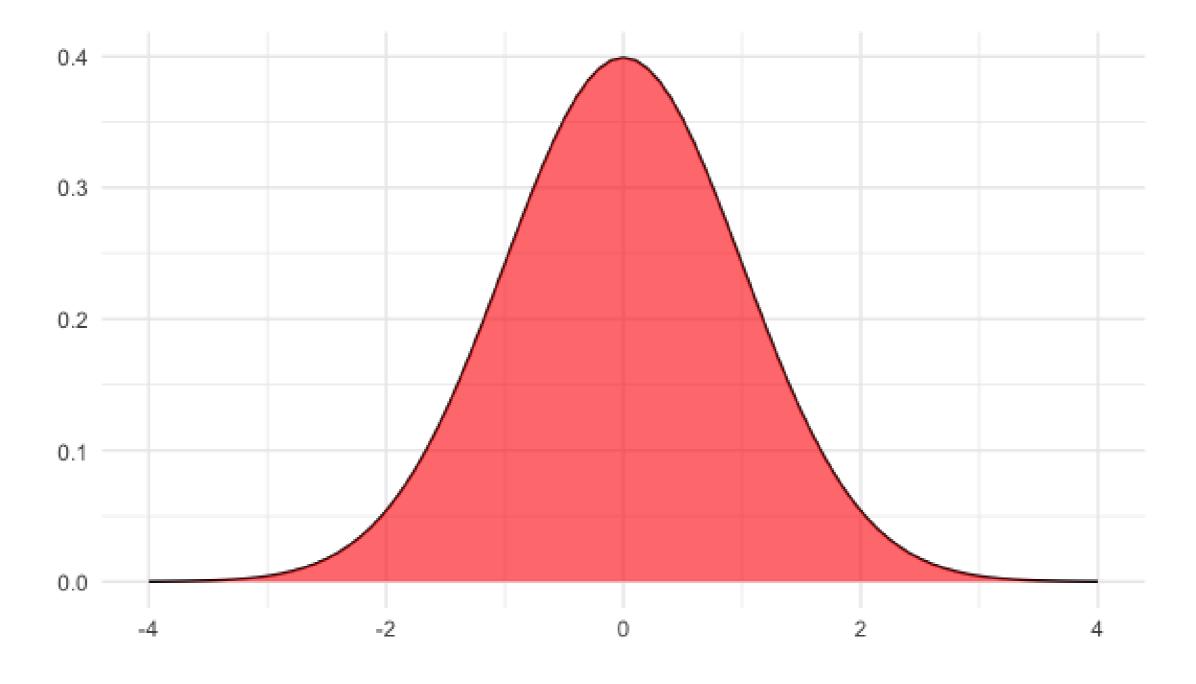

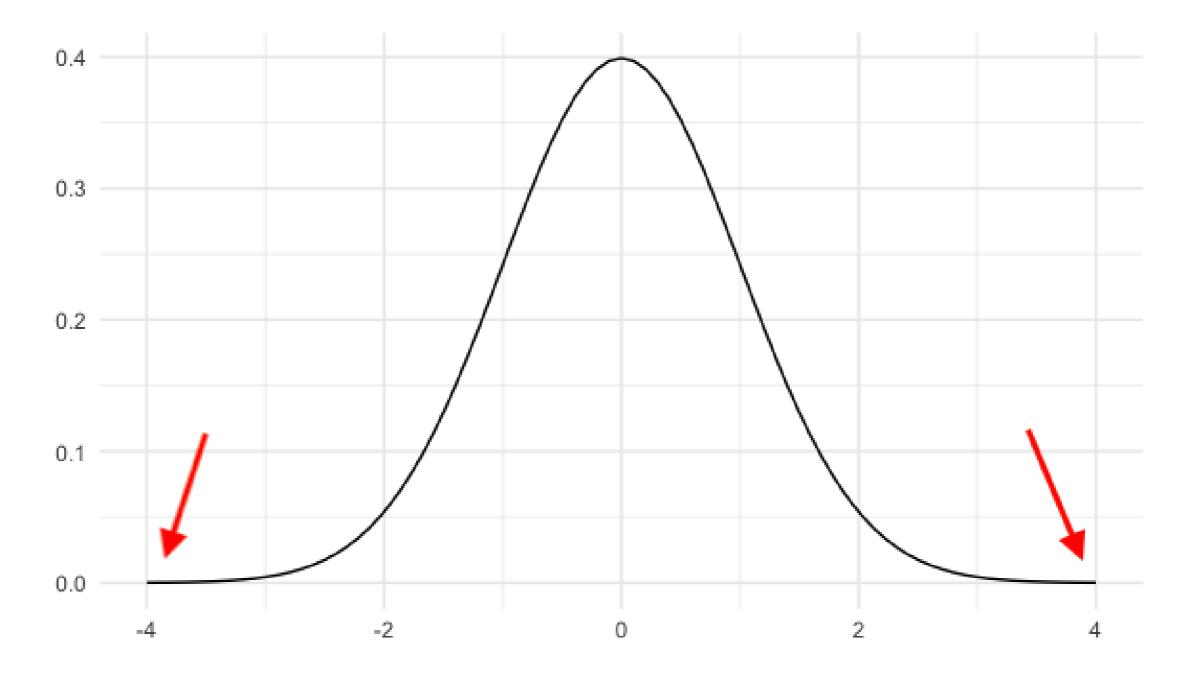

## Symmetrical

#### Area = 1

#### Curve never hits 0

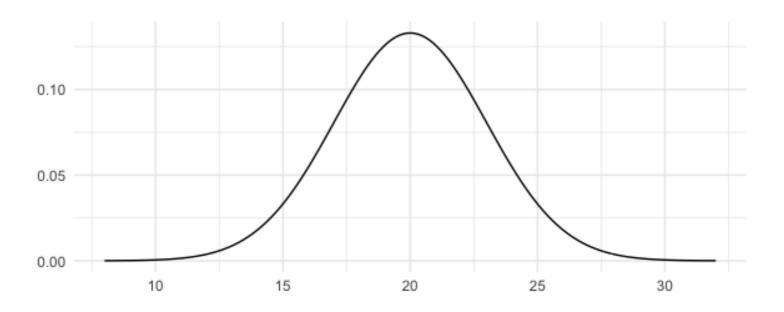

### Described by mean and standard deviation

Mean: 20

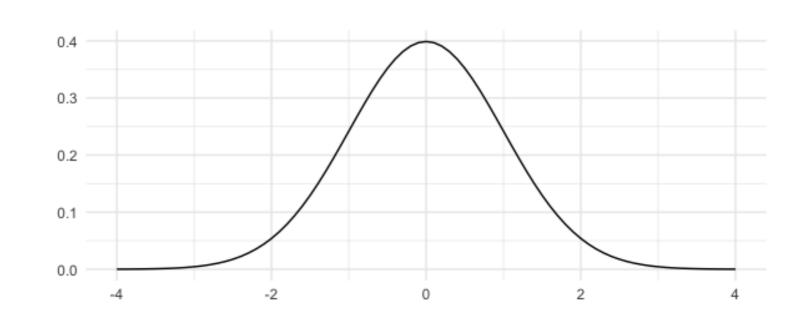

Standard deviation: 3

#### Standard normal distribution

Mean: 0

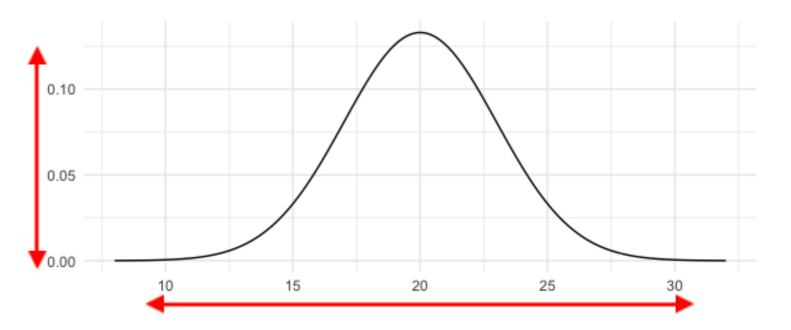

Standard deviation: 1

#### Described by mean and standard deviation

Mean: 20

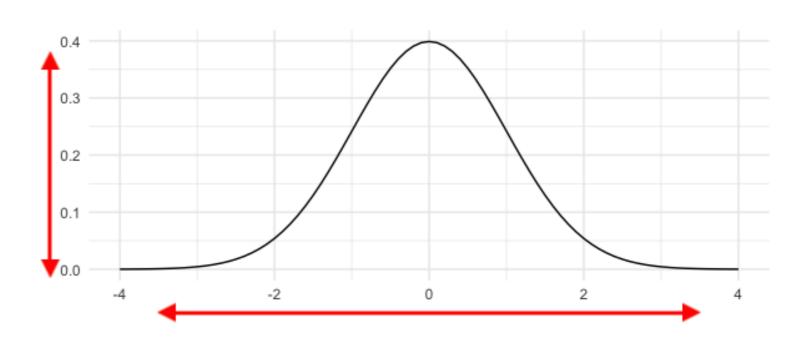

Standard deviation: 3

#### Standard normal distribution

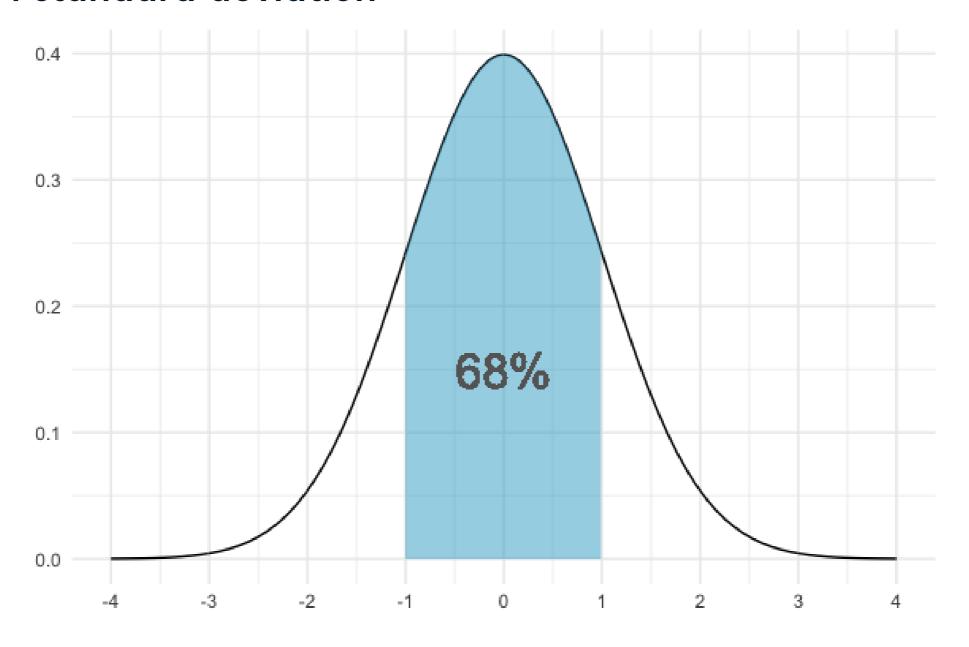

Mean: 0

Standard deviation: 1

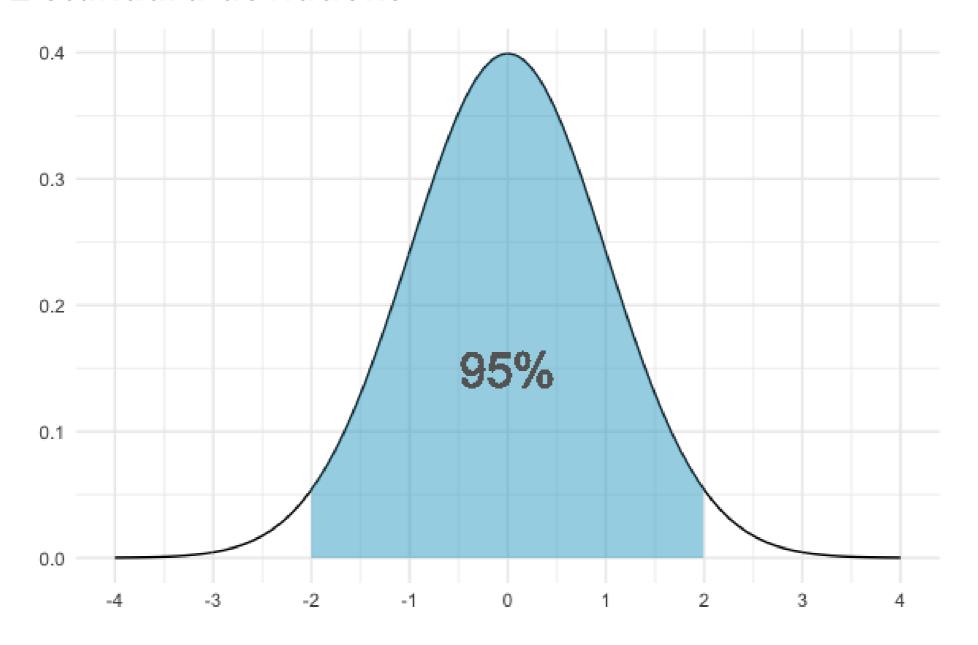

#### Areas under the normal distribution

#### 68% falls within 1 standard deviation

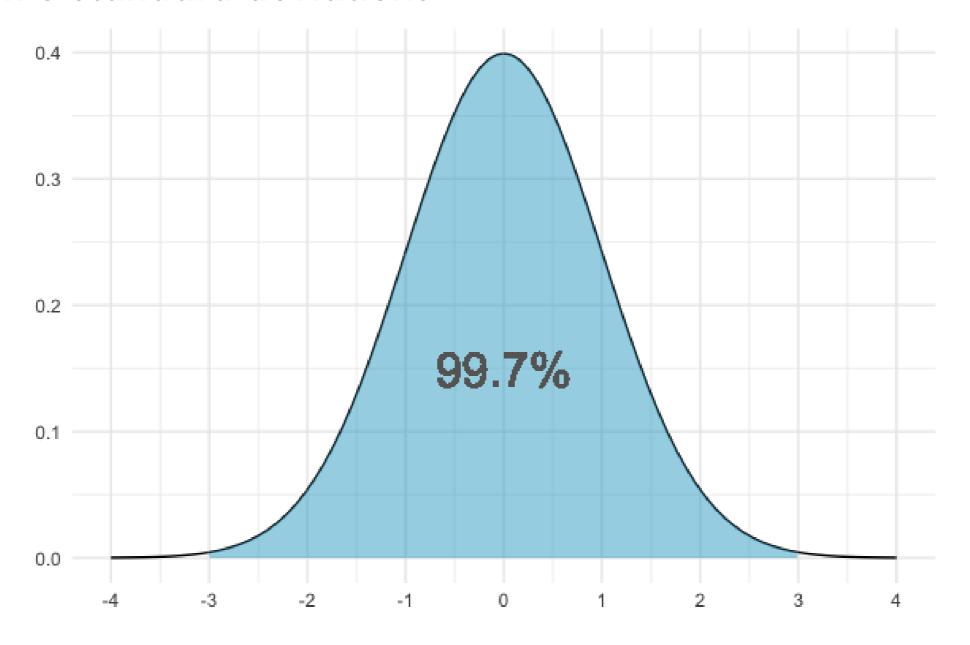

#### Areas under the normal distribution

#### 95% falls within 2 standard deviations

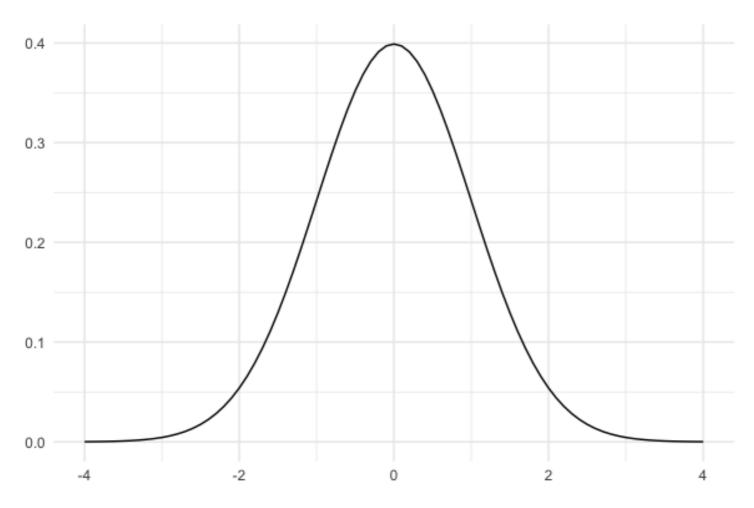

#### Areas under the normal distribution

#### 99.7% falls within 3 standard deviations

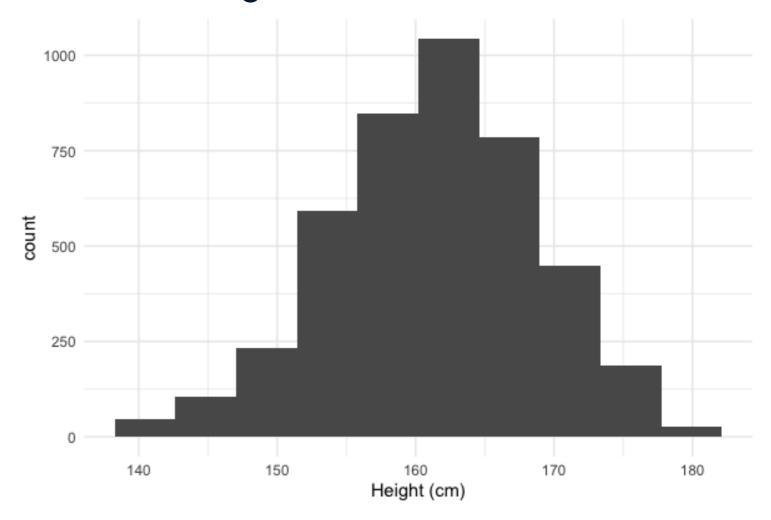

## Lots of histograms look normal

#### Normal distribution

#### Women's heights from NHANES

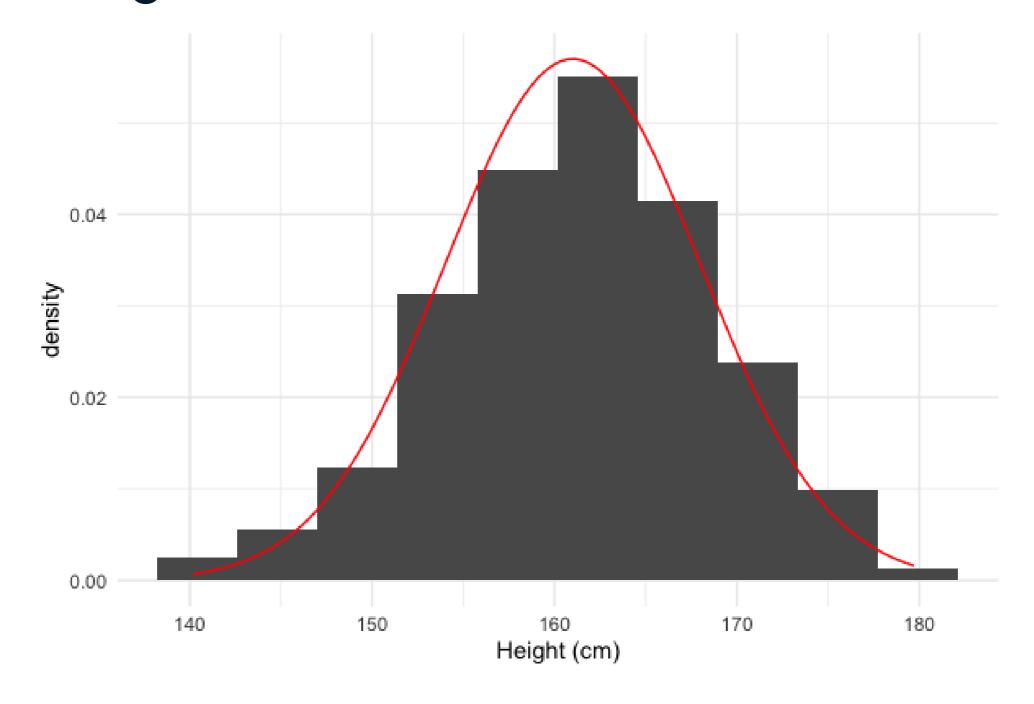

Mean: 161 cm

Standard deviation: 7 cm

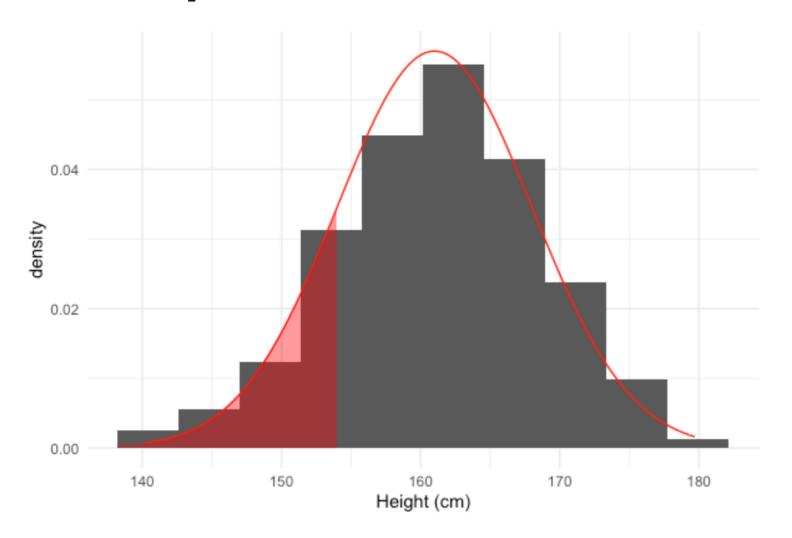

## Approximating data with the normal distribution

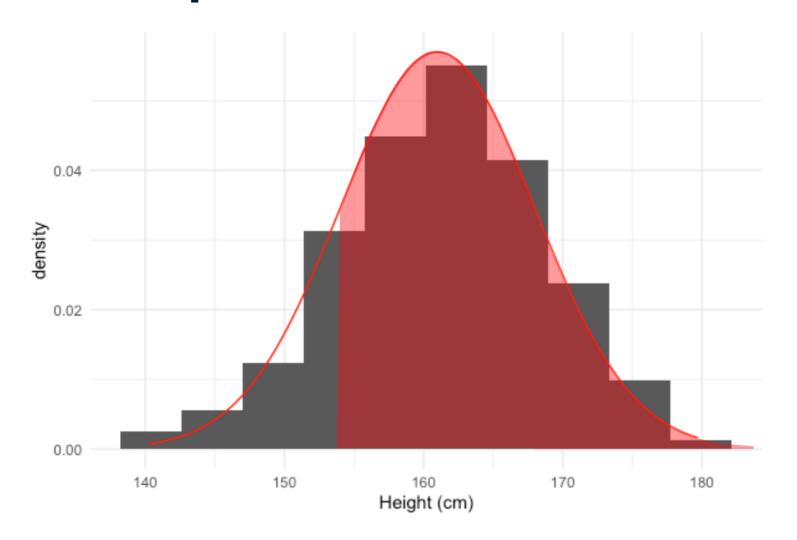

#### What percent of women are shorter than 154 cm?

16% of women in the survey are shorter than 154 cm

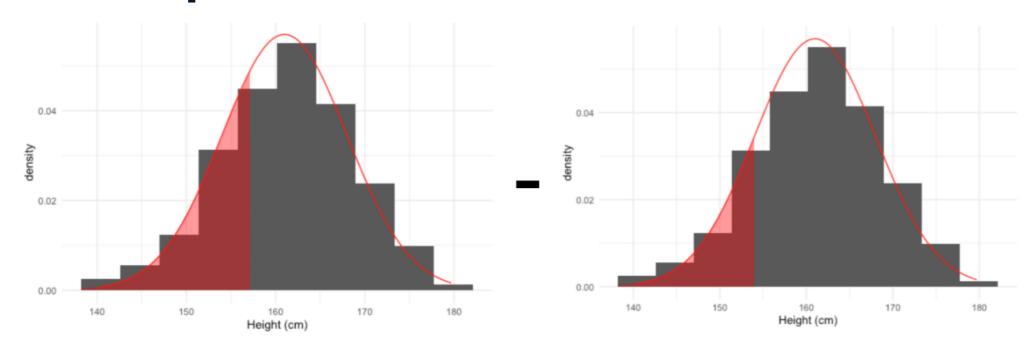

```
from scipy.stats import norm
norm.cdf(154, 161, 7)
```

#### What percent of women are taller than 154 cm?

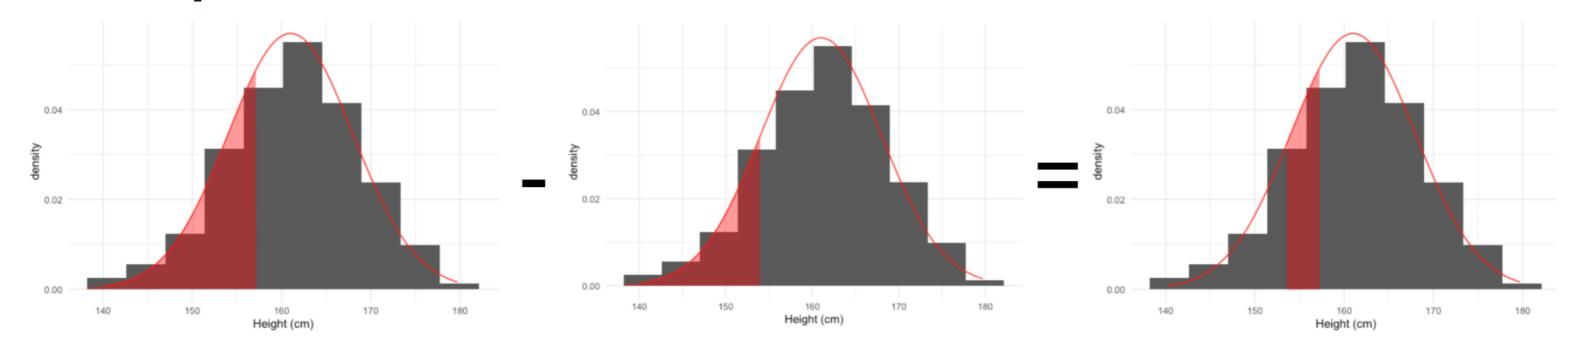

```
from scipy.stats import norm
1 - norm.cdf(154, 161, 7)
```

#### What percent of women are 154-157 cm?

norm.cdf(157, 161, 7) - norm.cdf(154, 161, 7)

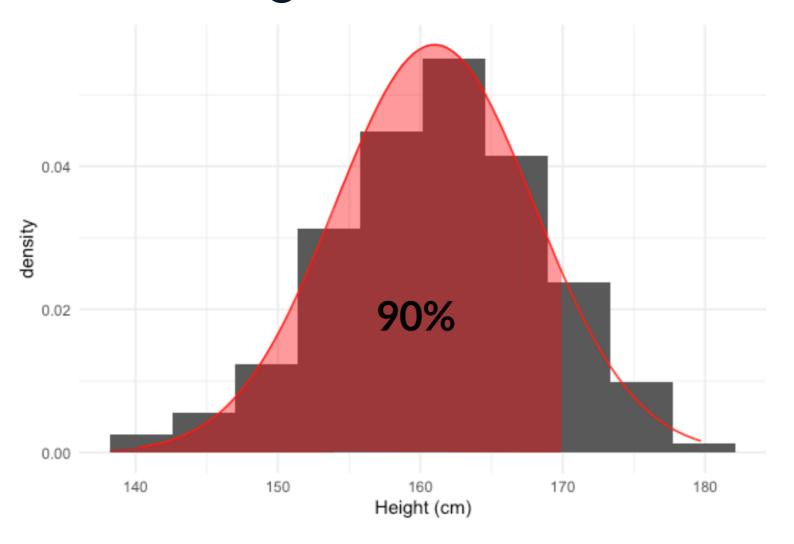

#### What percent of women are 154-157 cm?

norm.cdf(157, 161, 7) - norm.cdf(154, 161, 7)

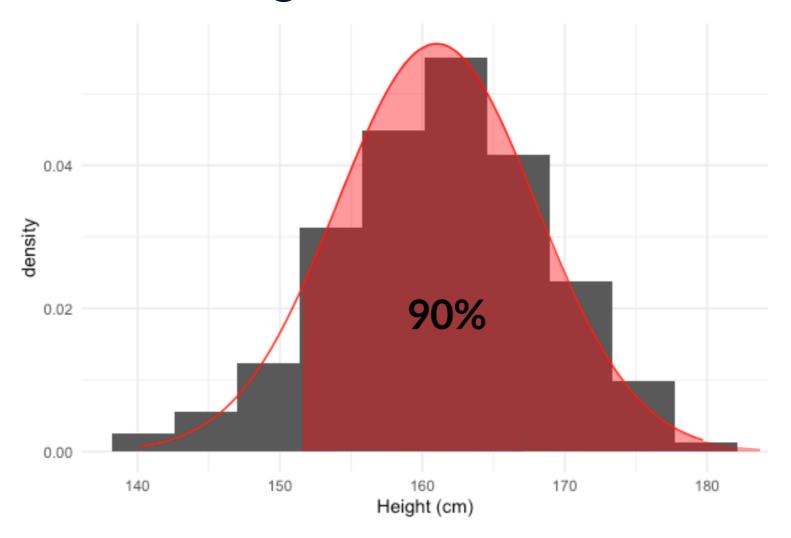

## What height are 90% of women shorter than?

norm.ppf(0.9, 161, 7)

## What height are 90% of women taller than?

norm.ppf((1-0.9), 161, 7)

#### Generating random numbers

## Let's practice!

INTRODUCTION TO STATISTICS IN PYTHON

# The central limit theorem

INTRODUCTION TO STATISTICS IN PYTHON

Maggie Matsui Content Developer, DataCamp

## Rolling the dice 5 times

```
die = pd.Series([1, 2, 3, 4, 5, 6])
# Roll 5 times
samp_5 = die.sample(5, replace=True)
print(samp_5)
```

array([3, 1, 4, 1, 1])

np.mean(samp\_5)

#### Rolling the dice 5 times

```
# Roll 5 times and take mean
samp_5 = die.sample(5, replace=True)
np.mean(samp_5)
```

#### 4.4

```
samp_5 = die.sample(5, replace=True)
np.mean(samp_5)
```

#### Rolling the dice 5 times 10 times

#### Repeat 10 times:

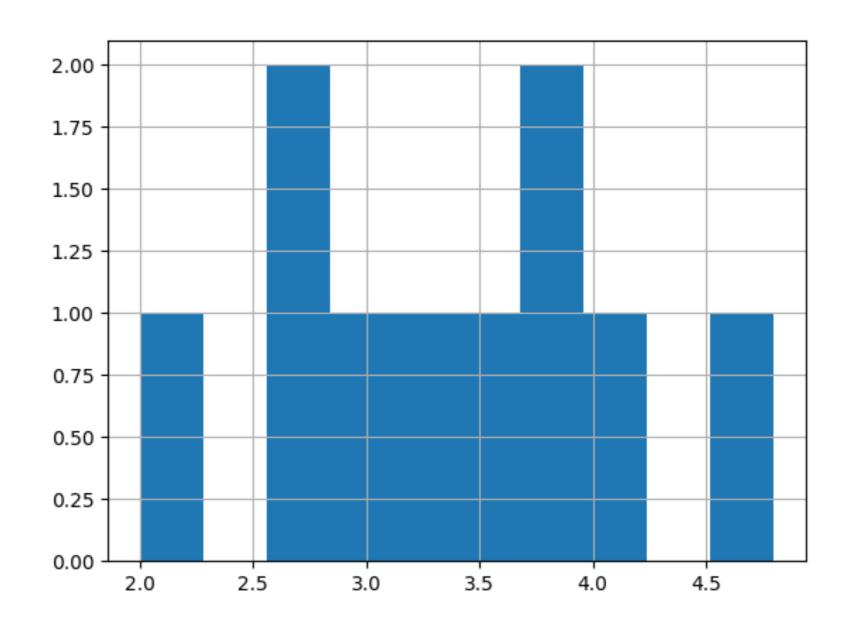

- Roll 5 times
- Take the mean

```
sample_means = []
for i in range(10):
    samp_5 = die.sample(5, replace=True)
    sample_means.append(np.mean(samp_5))
print(sample_means)
```

```
[3.8, 4.0, 3.8, 3.6, 3.2, 4.8, 2.6, 3.0, 2.6, 2.0]
```

## Sampling distributions

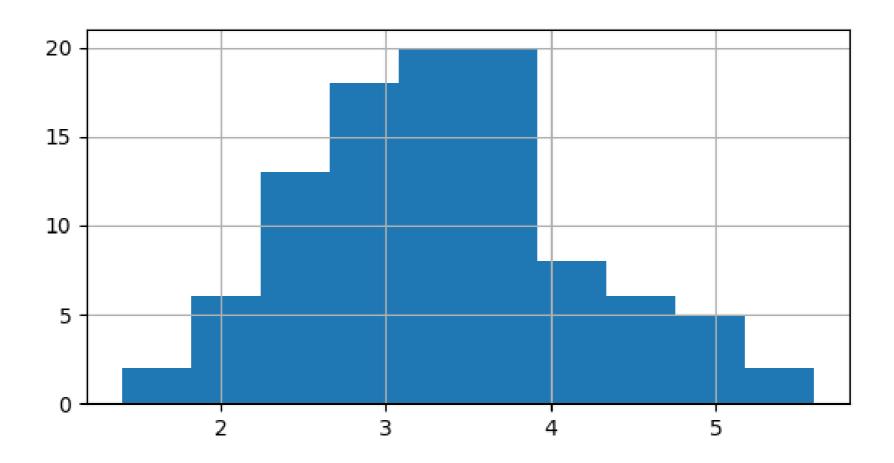

Sampling distribution of the sample mean

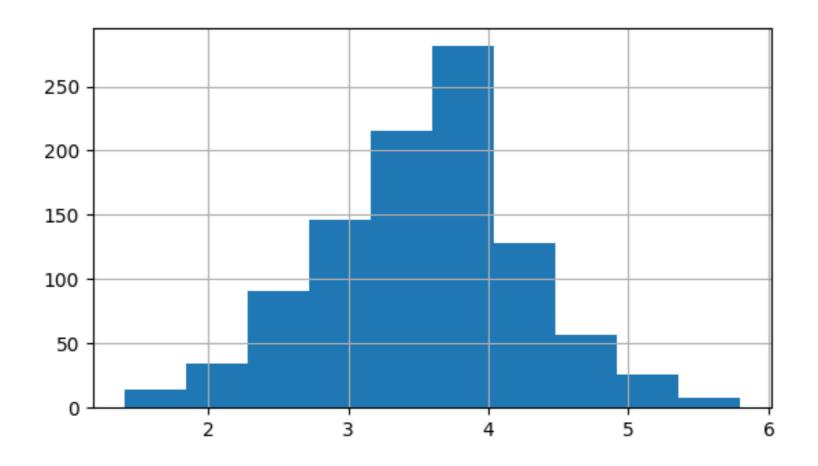

## 100 sample means

```
sample_means = []
for i in range(100):
    sample_means.append(np.mean(die.sample(5, replace=True)))
```

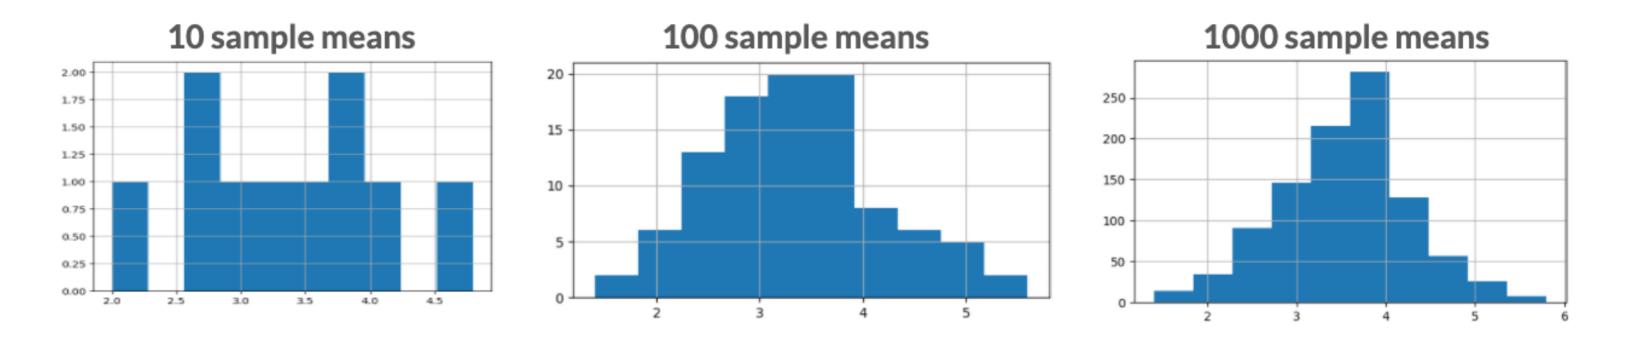

#### 1000 sample means

```
sample_means = []
for i in range(1000):
    sample_means.append(np.mean(die.sample(5, replace=True)))
```

#### Central limit theorem

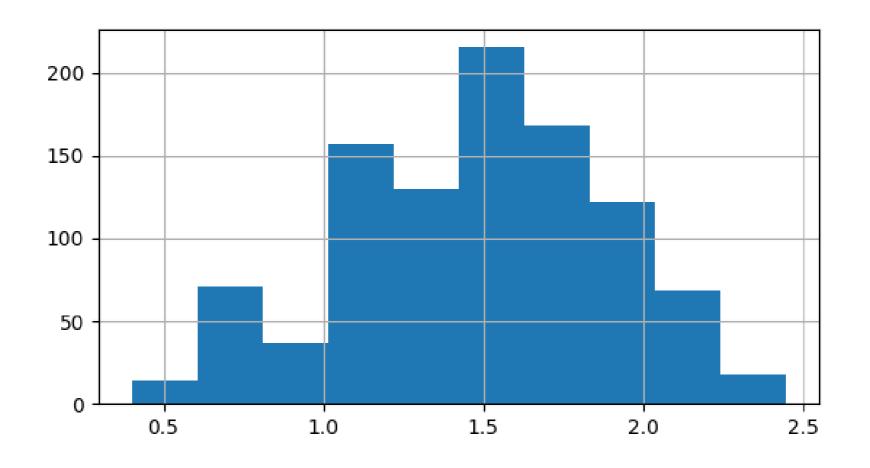

The sampling distribution of a statistic becomes closer to the normal distribution as the number of trials increases.

<sup>\*</sup> Samples should be random and independent

#### Standard deviation and the CLT

```
sample_sds = []
for i in range(1000):
    sample_sds.append(np.std(die.sample(5, replace=True)))
```

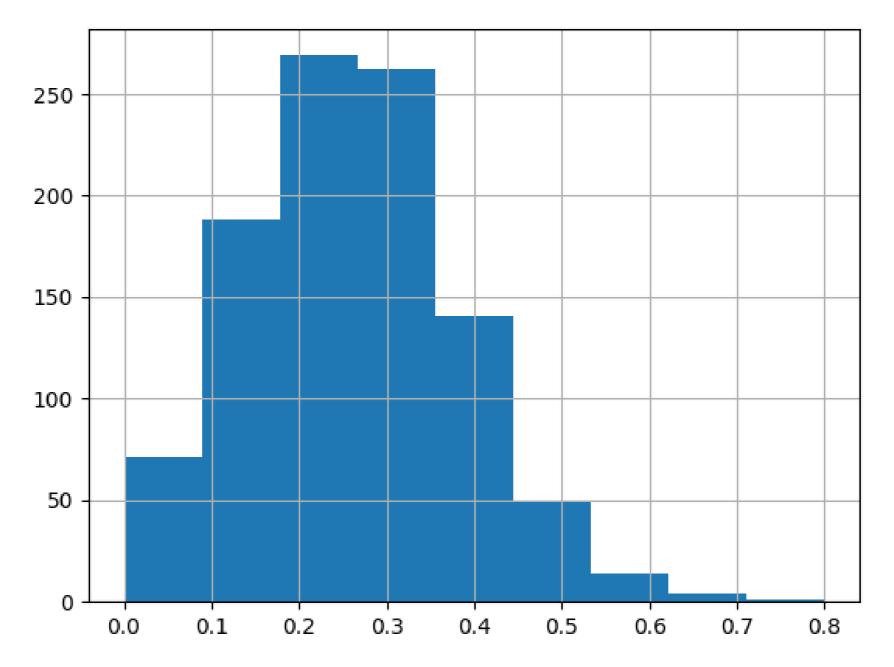

#### Proportions and the CLT

```
sales_team = pd.Series(["Amir", "Brian", "Claire", "Damian"])
sales_team.sample(10, replace=True)
array(['Claire', 'Damian', 'Brian', 'Damian', 'Damian', 'Amir', 'Amir', 'Amir',
      'Amir', 'Damian'], dtype=object)
sales_team.sample(10, replace=True)
array(['Brian', 'Amir', 'Brian', 'Claire', 'Brian', 'Damian', 'Claire', 'Brian',
      'Claire', 'Claire'], dtype=object)
```

## Sampling distribution of proportion

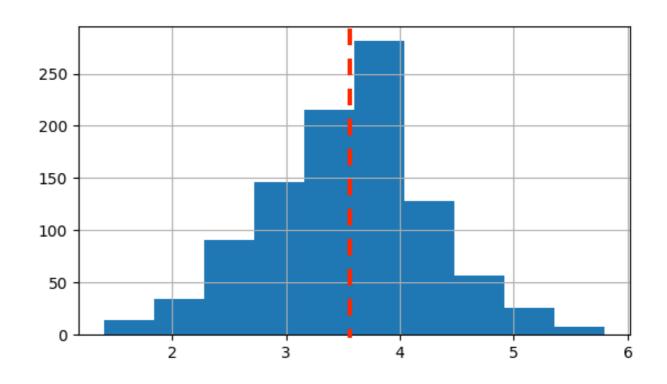

## Mean of sampling distribution

```
# Estimate expected value of die
np.mean(sample_means)
```

3.48

```
# Estimate proportion of "Claire"s
np.mean(sample_props)
```

- Estimate characteristics of unknown underlying distribution
- More easily estimate characteristics of large populations

## Let's practice!

INTRODUCTION TO STATISTICS IN PYTHON

# The Poisson distribution

INTRODUCTION TO STATISTICS IN PYTHON

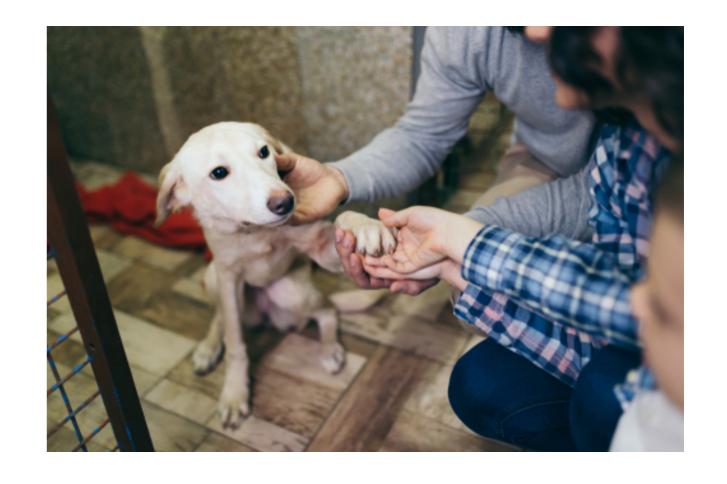

Maggie Matsui
Content Developer, DataCamp

#### Poisson processes

- Events appear to happen at a certain rate, but completely at random
- Examples
  - Number of animals adopted from an animal shelter per week
  - Number of people arriving at a restaurant per hour
  - Number of earthquakes in California per year
- Time unit is irrelevant, as long as you use the same unit when talking about the same situation

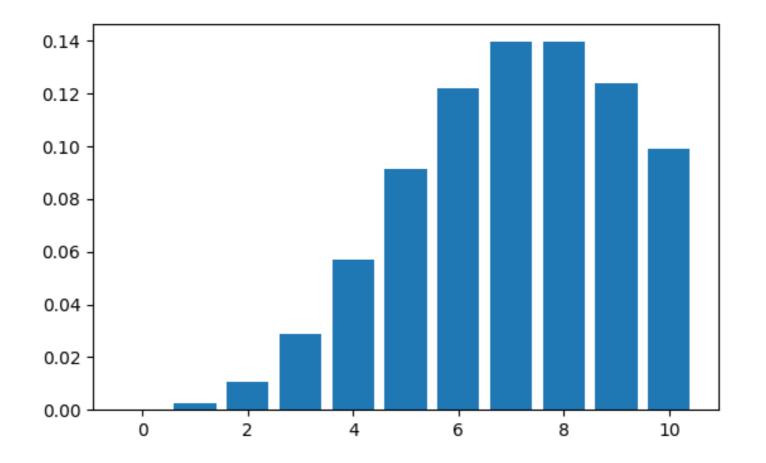

#### Poisson distribution

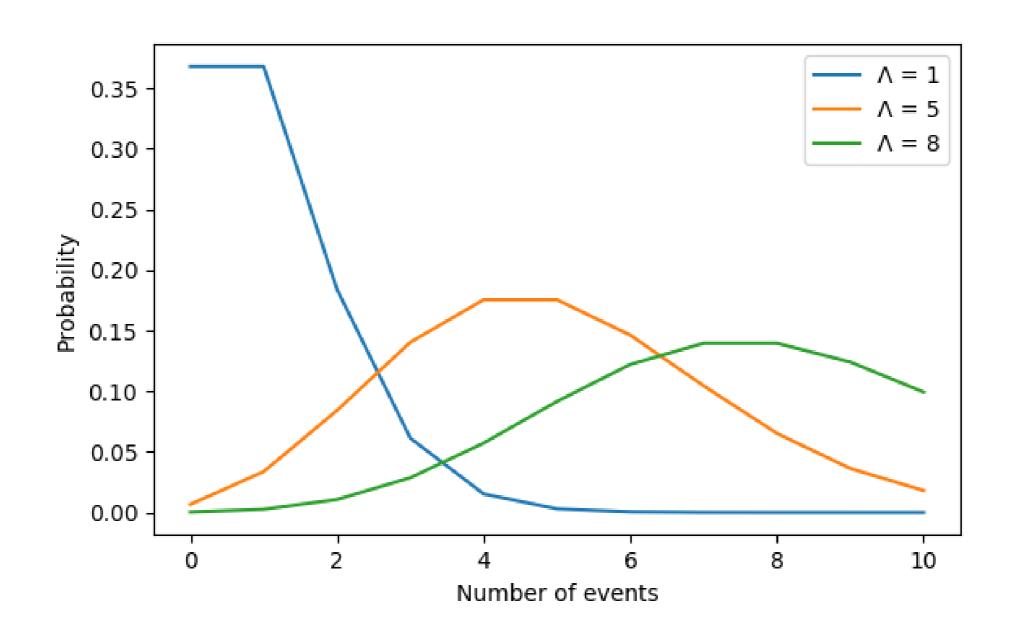

- Probability of some # of events occurring over a fixed period of time
- Examples
  - $\circ$  Probability of  $\geq$  5 animals adopted from an animal shelter per week
  - Probability of 12 people arriving at a restaurant per hour
  - Probability of < 20 earthquakes in California per year</li>

## Lambda ( $\lambda$ )

- $\lambda$  = average number of events per time interval
  - Average number of adoptions per week = 8

### Lambda is the distribution's peak

### Probability of a single value

If the average number of adoptions per week is 8, what is  $P(\# ext{adoptions in a week} = 5)$ ?

```
from scipy.stats import poisson
poisson.pmf(5, 8)
```

### Probability of less than or equal to

If the average number of adoptions per week is 8, what is  $P(\# \text{ adoptions in a week} \leq 5)$ ?

```
from scipy.stats import poisson
poisson.cdf(5, 8)
```

### Probability of greater than

If the average number of adoptions per week is 8, what is  $P(\# ext{adoptions in a week} > 5)$ ?

```
1 - poisson.cdf(5, 8)
```

### 0.8087639

If the average number of adoptions per week is 10, what is P(# adoptions in a week > 5)?

```
1 - poisson.cdf(5, 10)
```

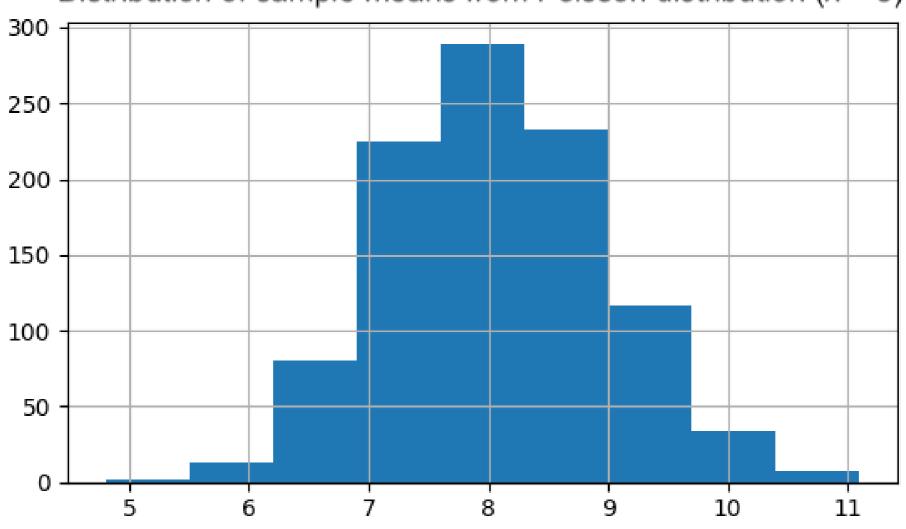

### Sampling from a Poisson distribution

```
from scipy.stats import poisson
poisson.rvs(8, size=10)
```

```
array([ 9, 9, 8, 7, 11, 3, 10, 6, 8, 14])
```

### The CLT still applies!

# Let's practice!

INTRODUCTION TO STATISTICS IN PYTHON

# More probability distributions

INTRODUCTION TO STATISTICS IN PYTHON

Maggie Matsui
Content Developer, DataCamp

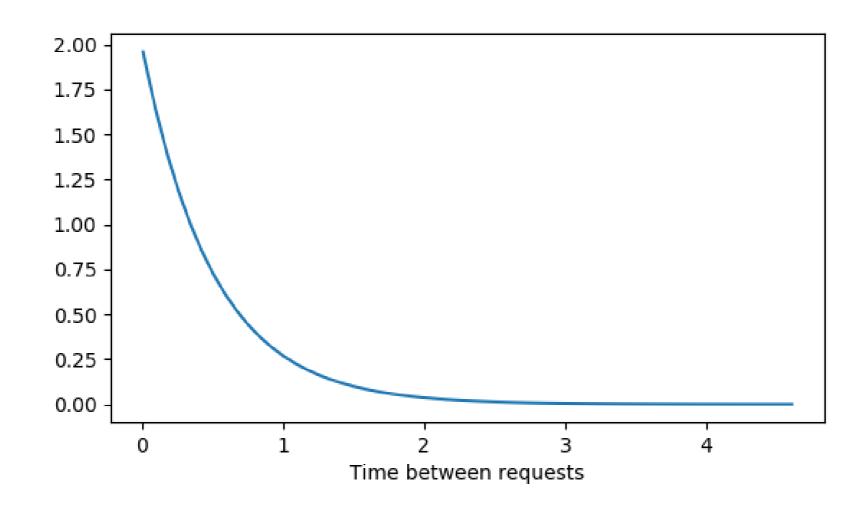

### **Exponential distribution**

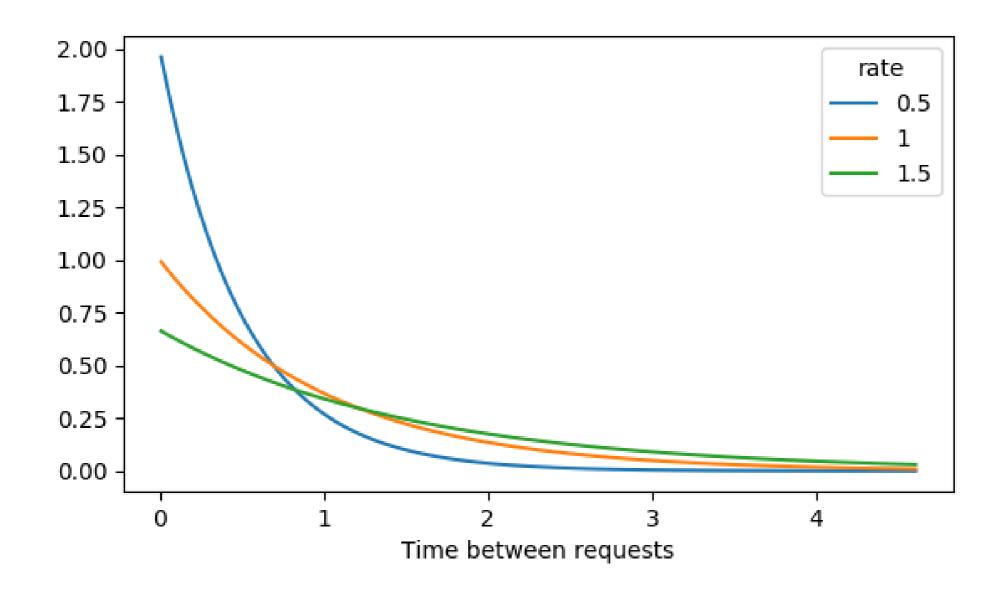

- Probability of time between Poisson events
- Examples
  - Probability of > 1 day between adoptions
  - Probability of < 10 minutes between restaurant arrivals</li>
  - Probability of 6-8 months between earthquakes
- Also uses lambda (rate)
- Continuous (time)

### Customer service requests

- On average, one customer service ticket is created every 2 minutes
  - $\circ$   $\lambda$  = 0.5 customer service tickets created each minute

### Lambda in exponential distribution

### Expected value of exponential distribution

In terms of rate (Poisson):

•  $\lambda = 0.5 \text{ requests per minute}$ 

In terms of time between events (exponential):

- $1/\lambda$  = 1 request per 2 minutes
- 1/0.5 = 2

### How long until a new request is created?

$$P(\text{wait} < 1 \text{ min}) =$$

from scipy.stats import expon

expon.cdf(1, scale=2)

• scale =  $1/\lambda = 1/0.5 = 2$ 

0.3934693402873666

$$P(\text{wait} > 4 \text{ min}) =$$

 $P(1 \min < \text{wait} < 4 \min) =$ 

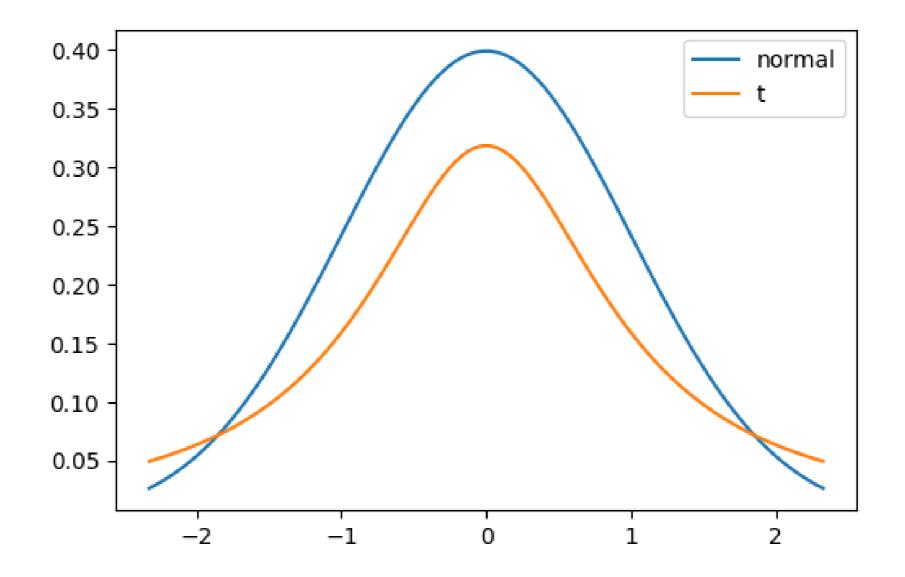

1- expon.cdf(4, scale=2)

expon.cdf(4, scale=2) - expon.cdf(1, scale=2)

0.1353352832366127

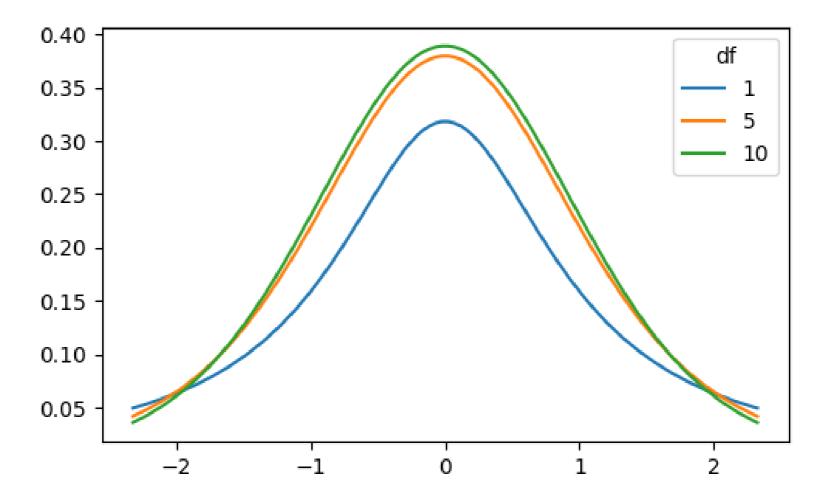

### (Student's) t-distribution

• Similar shape as the normal distribution

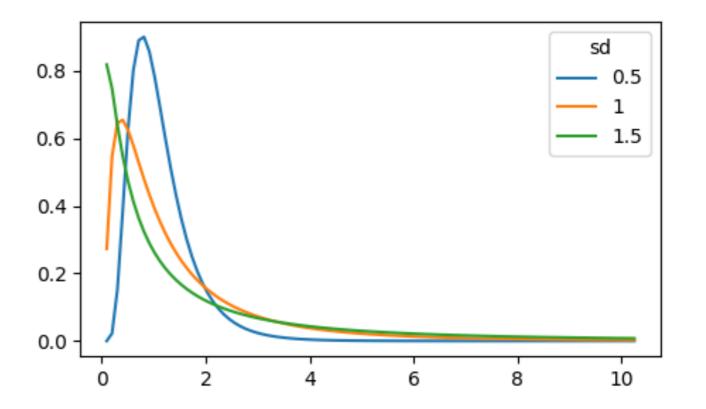

### Degrees of freedom

- Has parameter degrees of freedom (df) which affects the thickness of the tails
  - Lower df = thicker tails, higher standard deviation
  - Higher df = closer to normal distribution

### Log-normal distribution

- Variable whose logarithm is normally distributed
- Examples:
  - Length of chess games
  - Adult blood pressure
  - Number of hospitalizations in the 2003
     SARS outbreak
